

DANIEL BAILEY

Backend Engineer | API & Database Architecture | Python · FastAPI · PostgreSQL
Chino Hills, CA • krispedgez@gmail.com • github.com/Pr1nc3B33 • linkedin.com/in/benny-bailey

SUMMARY

Backend engineer specializing in REST API design and relational data modeling, with a 15-year prior career safeguarding multi-terabyte media pipelines for film and television. Designs normalized PostgreSQL schemas and FastAPI services with authentication, audit trails, and CI/CD built in — bringing a zero-fault, data-integrity discipline from high-stakes production sets to scalable software.

TECHNICAL SKILLS

- **APIs & Architecture:** REST, FastAPI, OpenAPI / Swagger, Pydantic validation, CRUD design, third-party integrations
- **Databases:** PostgreSQL, MySQL, SQLAlchemy 2.0, Alembic migrations, schema design (3NF), SQL optimization, indexing
- **Languages:** Python, SQL; TypeScript / JavaScript (ES6+)
- **DevOps & Practices:** Docker, Kubernetes, Git, GitHub Actions CI/CD, Pytest, OOP, SOLID, Agile / Scrumban
- **AI-Assisted Engineering:** Claude Code, Cursor, GitHub Copilot — architecture, code review, and test generation

EXPERIENCE

MedBridge — Backend Lead · Team Capstone Project 2026

AI-assisted patient health-records platform — FastAPI · PostgreSQL

- Designed the relational data model: an **8-table normalized PostgreSQL schema** (users, sessions, documents, lab results, conversations, messages, audit log, usage events) with FK-enforced integrity and a full audit trail on every mutation.
- Built the FastAPI service layer and project scaffolding — defining REST endpoints, **Pydantic request/response contracts**, and token-based auth with session management.
- Established the team's GitHub monorepo and PR review workflow as backend lead, coordinating schema scoping across frontend, QA, and data-analyst stakeholders.

On-Set Data Manager — Film & Television · Freelance 2005 – 2022

- Ran end-to-end digital media ingestion pipelines for 15+ years with **100% data integrity and zero asset loss** across multi-terabyte deliverables.
- Enforced automated checksum verification on every transfer, maintaining zero corruption under live, hour-by-hour production deadlines.
- Coordinated technical handoffs across directors, producers, and post-production engineers to align pipelines with creative goals.

PROJECTS

Coding Temple Capstone — Full-Stack Engineering · Remote 2026

- Designed and documented RESTful endpoints for product-catalog and order-processing flows with clean separation of concerns and robust data contracts.
- Configured a GitHub Actions CI/CD pipeline automating lint, test, and build on every commit, eliminating manual deployment risk.

Portfolio Analytics Engine — Personal Project 2026 – Present

- Python backend computing quantitative-finance metrics (total return, annualized volatility, Sharpe ratio, max drawdown) over live market data via the yfinance API.
- Used hash-map lookups for **O(1)** access during statistical passes; covered with pytest suites verifying numerical correctness across datasets.

SmallBiz Desktop App — Open Source 2026 – Present

- Cross-platform Electron tool with an offline-first, local-storage architecture and an async layer modeled on REST patterns for predictable, modular state updates.

EDUCATION

- **Full Stack Developer Bootcamp — Coding Temple (2026):** 6-month program completed in 3 months (35+ hrs/week) — Python, Node.js, PostgreSQL, REST APIs, DevOps.
- **B.F.A., Visual Arts** — Brooks Institute, Santa Barbara (2009)
- **A.A., Audio Engineering & Acoustics** — Citrus College (2001)
